Audrey Theriault-Allaire

Vancouver, WA • audreytcodes@gmail.com • github.com/audreycode6 • linkedin.com/in/audrey-theriault-allaire/

Full-stack software engineer skilled in Python and JavaScript. A background in teaching set the foundation for breaking complex problems into sequenced, deliverable pieces.

Projects / Technical Experience

Budget Thing — Budgeting App | Python, Flask, PostgreSQL, JavaScript, Docker, GitHub Actions, AWS

- Plans monthly or annual budgets against gross income, with expenses grouped into bills, savings, and debt; a session-authenticated JSON API serves a vanilla JavaScript frontend.
- Deployed to AWS Lightsail with Docker Compose running the app, PostgreSQL, and Caddy as a reverse proxy terminating HTTPS on a custom domain with automatic certificate renewal.
- Enforced object-level authorization on every write: data is looked up only if it belongs to the logged-in user, and requests for another user's data get the same 404 as data that doesn't exist.
- Wrote 119 tests across handler, service, and two-user integration layers, run by GitHub Actions on every push before a merge can deploy.

Verbal Habits — macOS Menu Bar App | Python, PyObjC, pytest

- Transcribes speech on-device and keeps a live count of every word on a tracked list, ending each session with per-word counts and their percentage of total words spoken.
- Wrote a technical design doc, then de-risked its open questions with spikes against Apple's frameworks before writing application code.
- Kept counts accurate across long sessions despite a recognizer that revises partial transcripts and periodically restarts them: matched only against finalized segments, and detected a restart by a sharp drop in transcript length, so no count on screen was ever retracted.
- Isolated the matching and session-stats logic in pure-Python modules with no Apple framework dependency, so they run and test in isolation: 101 pytest tests replay recorded transcripts instead of live audio.

Mood Map — Mood-Tracking App | Python, Flask, PostgreSQL, HTML/CSS, Jinja

- Records daily emotional check-ins covering mood, energy level, emotions, and a written reflection, with all SQL kept in one data access layer as parameterized queries.
- Designed a three-table schema modeling emotions as one-to-many per entry, with cascading deletes and unique constraints enforcing one entry per user per day and no repeated emotion per entry.
- Delivered paginated history views with full CRUD for entries and their emotions, with server-side validation that re-renders forms with the user's input intact.

Professional Work Experience

First Grade Teacher — Education for Change Public Schools, Learning Without Limits | 2021-2023

- Led a classroom of 20+ first graders, planning daily instruction across all core subjects with grade-level teams and specialists; served as primary point of contact for 50+ families, translating assessment data into plain language.
- Designed and built the science and social studies curriculum from scratch: scoped a full year of material against state standards, sequenced it around learning goals, and delivered it on a fixed calendar.
- Identified a participation gap in whole-class discussion and redesigned the format around peer-discussion protocols, alternatives to hand-raising, and exit tickets that measured whether every student was reached.

Education

Launch School — Core Curriculum, Python Pathway | 2024-2026 (*expected*)
Software engineering program (1,500+ hours | 27 courses) covering programming fundamentals, data structures & algorithms, databases, networking, and security.
Certification: Harvard University — CS50 Intro to Computer Science | 2023
Saint Mary's College of California — Bachelor of Arts | 2021

Skills

Languages: Python, JavaScript, SQL, HTML/CSS
Frameworks & Libraries: Flask, Jinja, SQLAlchemy, PyObjC
Databases & Tools: PostgreSQL, SQLite, Git, pytest, unittest, Poetry, AWS, Docker
